Alstrut brings you MODU standard conveyor components that facilitates the construction of standardized function blocks which occur frequently in many conveyor applications. These components provide quick and cost effective solutions in a number of industrial segments with extensive experience and comprehensive product range.

The acetal co-polymer chain is the backbone of every conveyor designed to make sharp radius either horizontal or vertical with every low friction, low noise and high cleanliness. The conveyor beam, support structure, guide rail and some other accessories are made from anodized aluminium alloy. Alstrut provides MODU conveyors of various sizes for different applications. The range of conveyors starts from 63mm to 225mm chain.

In the conventional conveyor system normally the belt & roller are difficult to install and dismantle, expensive to build and maintain, and can not be reconfigured. In line with the Alstrut's key elements 'design for assembly', 'design for flexibility', 'design for aesthetics', solutions offered by the MODU conveyors are flexible, which makes it cost effective.
